

## SafeTok. Multipurpose, All Factor Authentication.

SafeTok is a multipurpose all factor access and authentication solution housed in a biometric USB pen drive format.

It enables laptop, desktop, intranet and website users to authenticate access to IT resources and protect their user accounts from all currently known cyber-attacks. SafeTok was designed to provide maximum security, yet to be easy to use.

All factor authentication is a fast emerging identity and access management technology which is becoming increasingly relevant as organisations deploy a wider range of risk related user authentication processes in order to comply with a fast changing threat landscape.

SafeTok is a unique solution to the problem of employee resistance to using secure access. It's easy to learn and use, little or no training is required, no changes are needed to current IT systems or infrastructure and there are no changes to established working practices or workflow. Safetok achieves this by balancing usability, security, productivity and compliance.

A single SafeTok device can securely log a user into their Vista or Windows 7 laptop or desktop PC, into an encrypted hard disk drive, a corporate intranet, supply chain networks, public internet accounts, cloud based resources and corporate application software.

### Fingerprint verification

SafeTok enables users to authenticate themselves to their accounts using just their fingerprint.

Fingerprints are the most secure and reliable type of personal biometrics currently available.

To login a user just scans their finger over the SafeTok USB drive fingerprint sensor. Once verified by the SafeTok authentication server only the authorised user will be able to gain access.

- A SafeTok USB drive can store non sensitive files without fingerprint protection.
- Confidential files are stored in a secure area of the USB drive and retrieved using fingerprint protection
- One device secures multiple devices and multiple accounts
- Password resets can be "pushed" to the SafeTok device
- More complex and therefore more secure passwords can be used.
- The password is not revealed to any unauthorized person at any time.
